

# 1 Compact topological spaces

Recall the definition of an open cover:

**Definition 1.1. (Open covers; open subcovers.)** Let  $(X, \mathcal{T})$  be a topological space. A collection  $\{U_i\}_{i \in I}$  of open subsets of  $X$  is an *open cover* of  $X$  if  $X = \bigcup_{i \in I} U_i$ . In other words, every point in  $X$  lies in the set  $U_i$  for some  $i \in I$ .

A sub-collection  $\{U_i\}_{i \in I_0}$  (where  $I_0 \subseteq I$ ) is an *open subcover* (or simply *subcover*) if  $X = \bigcup_{i \in I_0} U_i$ . In other words, every point in  $X$  lies in some set  $U_i$  in the subcover.

**Definition 1.2. (Compact spaces; compact subspaces.)** We say that a topological space  $(X, \mathcal{T})$  is *compact* if **every** open cover of  $X$  has a finite subcover.

A subset  $A \subseteq X$  is called *compact* if it is compact with respect to the subspace topology. This means ...

**Example 1.3.** Let  $(X, \mathcal{T})$  be a finite topological space. Then  $X$  is compact.

**Example 1.4.** Let  $X$  be a topological space with the indiscrete topology. Then  $X$  is compact.

**Example 1.5.** Let  $X$  be an infinite topological space with the discrete topology. Then  $X$  is **not** compact.

## In-class Exercises

1. (a) Let  $X$  be a set with the cofinite topology. Prove that  $X$  is compact.  
 (b) Let  $X = (0, 1)$  with the topology induced by the Euclidean metric. Show that  $X$  is not compact.
2. Suppose that  $(X, \mathcal{T}_X)$  and  $(Y, \mathcal{T}_Y)$  are topological spaces, and  $f : X \rightarrow Y$  is a continuous map. Show that, if  $X$  is compact, then  $f(X)$  is a compact subspace of  $Y$ . In other words, the continuous image of a compact set is compact.
3. Prove that a closed subset of a compact space is compact.
4. (a) Let  $X$  be a topological space with topology induced by a metric  $d$ . Prove that any compact subset  $A$  of  $X$  is bounded.  
 (b) Suppose that  $(X, \mathcal{T})$  is a **Hausdorff** topological space. Prove that any compact subset  $A$  of  $X$  is closed in  $X$ .  
 (c) Consider  $\mathbb{Q}$  with the Euclidean metric. Show that the subset  $(-\pi, \pi) \cap \mathbb{Q}$  of  $\mathbb{Q}$  is closed and bounded, but not compact.
5. (**Optional**). Determine which of the following topologies on  $\mathbb{R}$  are compact.
 

<ul style="list-style-type: none"> <li>• Any topology <math>\mathcal{T}</math> consisting of only finitely many sets.</li> <li>• the discrete topology</li> </ul>	<ul style="list-style-type: none"> <li>• <math>\mathcal{T} = \{(a, \infty) \mid a \in \mathbb{R}\} \cup \{\emptyset\} \cup \{\mathbb{R}\}</math></li> <li>• <math>\mathcal{T} = \{A \mid A \subseteq \mathbb{R}, 0 \in A\} \cup \{\emptyset\}</math></li> <li>• <math>\mathcal{T} = \{A \mid A \subseteq \mathbb{R}, 0 \notin A\} \cup \{\mathbb{R}\}</math></li> </ul>
---	---
6. (**Optional**). Consider  $\mathbb{R}$  with the topology  $\mathcal{T} = \{A \mid A \subseteq \mathbb{R}, 0 \notin A\} \cup \{\mathbb{R}\}$ . Give necessary and sufficient conditions for a subset  $C \subseteq \mathbb{R}$  to be compact.
7. (**Optional**). Let  $X$  be a nonempty set, and let  $x_0$  be a distinguished element of  $X$ . Let
 
$$\mathcal{T} = \{A \subseteq X \mid x_0 \notin A \text{ or } X \setminus A \text{ is finite}\}.$$
  - (a) Show that  $\mathcal{T}$  defines a topology on  $X$ .
  - (b) Verify that  $(X, \mathcal{T})$  is Hausdorff.
  - (c) Verify that  $(X, \mathcal{T})$  is compact.

This exercise shows that **any** nonempty set  $X$  admits a topology making it a compact Hausdorff topological space.
8. (**Optional**). Let  $K_1 \supseteq K_2 \supseteq \dots$  be a descending chain of nonempty, closed, compact sets. Then  $\bigcap_{n \in \mathbb{N}} K_n \neq \emptyset$ .
9. (**Optional**). Let  $X$  be a topological space, and let  $A, B \subseteq X$  be compact subsets.
  - (a) Suppose that  $X$  is Hausdorff. Show that  $A \cap B$  is compact.
  - (b) Show by example that, if  $X$  is not Hausdorff,  $A \cap B$  need not be compact.  
*Hint:* Consider  $\mathbb{R}$  with the topology  $\{U \mid U \subseteq \mathbb{R}, 0, 1 \notin U\} \cup \{\mathbb{R}\}$ .
10. (**Optional**). Suppose that  $(X, \mathcal{T}_X)$  and  $(Y, \mathcal{T}_Y)$  are topological spaces, and  $f : X \rightarrow Y$  is a closed map (this means that  $f(C)$  is closed for every closed subset  $C \subseteq X$ ). Suppose that  $Y$  is compact, and moreover that  $f^{-1}(y)$  is compact for every  $y \in Y$ . Prove that  $X$  is compact.
